

Weekly Swine Flu Update

Thursday 22 October

- The flu-like illness rate in England from the Royal College of General Practitioners (RCGP) scheme increased to 39.1 per 100,000 in week 42 compared to 29.1 in week 41. An increase was seen in all age groups.
- The main burden of flu-like illness nationally is in the 1-4 and 5-14 years age groups.
- This week, the antiviral collection numbers in the National Pandemic Flu Service have continued to increase and this has been seen in all age groups except the 75+. The largest increase (40%) in week 42, compared with week 41, was seen in the 5-14 year olds.
- Interpretation of data to produce estimates on the number of new cases continues to be subject to a considerable amount of uncertainty. HPA modelling gives an estimate of 53,000 new cases in England last week (range 27,000 to 115,000) compared with 27,000 in week 41. This is a 96% increase. This estimate incorporates data from National Pandemic Flu Service and GP consultations.

Following the move from laboratory testing for confirmation of swine flu to clinical diagnosis of cases, the level of flu in the community is being monitored using a range of surveillance mechanisms, including the RCGP consultation rates, QSurveillance®, and the National Pandemic Flu Service.

Current plans are to issue a factual swine flu update every Thursday afternoon on the HPA website. These plans will be kept under review.
